

UiPath automates the testing. Synthesized automates the data.

Bring AI-native test data automation into UiPath Test Cloud. Prepare production-realistic, connected data on demand, with configured privacy controls. Reduce data-related blockers and make test scenarios easier to repeat.

On demand

Data preparation within the test workflow

Scenario-ready

Success, rejection, boundary and edge cases

Connected

Related data across systems in scope

Reusable

Configured workflows for repeat test cycles

Why It Matters for Your Business

The right test data at the right scale delivered directly into your Test Cloud workflow.

Release Faster

Test data is generated and refreshed in minutes, not weeks. Test Cloud teams stop waiting on data and start testing, so releases ship on schedule.

Reduce Risk

Every dataset is privacy-safe by design. Cut compliance exposure and avoid regulatory fines that average €2.36 million per GDPR violation.

Scale With Confidence

One platform covers SAP, Salesforce, Oracle and more. Test whole business processes, not just tables, across your entire application landscape.

Automated Tests Should Not Wait on Manual Data

A test can be fully automated and still be blocked. Records may be missing, consumed by earlier runs or inconsistent across applications. Production copies may need approved treatment before use.

Synthesized platform makes data preparation a repeatable step in the UiPath testing workflow. Teams reuse the configured workflow instead of rebuilding data preparation for each run.

How the Integration Works

01 Define

Set the scenario, systems, data and privacy rules.

02 Request

UiPath invokes the configured data workflow.

03 Prepare

Synthesized generates, transforms or provisions data.

04 Execute

UiPath runs the test once data and environment are ready.

05 Reuse

Rerun the data workflow for later test cycles.

What Changes With Synthesized + UiPath Test Cloud

Business Area	With Manual Data Preparation	With Synthesized + UiPath
Test data readiness	Manual creation and uploads delay testing by days or weeks for every QA and production refresh.	Datasets generated in minutes. Always-on test data availability for every Test Cloud test cycle.
Effort to prepare data	6–8 person-days of manual work per 1,000 records, created and maintained by hand.	Up to 90% less manual effort. Reusable test automation paired with reusable test data.
Compliance & privacy	Production data copies with ad-hoc masking expose teams to major regulatory fines.	Privacy-safe synthetic and masked data, generated automatically. Data privacy risk eliminated.
SAP & cross-system testing	SAP and non-SAP relationships maintained manually. Brittle, slow and inconsistent.	SAP and non-SAP test data generated together, at any scale, with data integrity preserved.
Release velocity	Test data delays block quarterly releases and feature packs.	Self-service, on-demand provisioning keeps pace with continuous delivery.

Where Teams Use It Together

S/4HANA migration & upgrade testing

Cross-system integration testing (SAP + non-SAP)

High-volume regression & performance testing

Compliance-safe automated testing

Continuous, AI-driven test automation

Enterprise apps: SAP, Salesforce, Oracle & more

Built for the Teams Behind Every Release

 QA and test leads

Spend less time on data setup. Focus on coverage and repeatability.

 DevOps and developers

Bring data preparation into automated delivery workflows.

 Technology leaders

Automate testing while reducing data storage and infrastructure costs.

Request a Demo
